A study being conducted at the University of Queensland is investigating ways to support older people living with dementia adjust to life without driving

**CarFreeMe**

We are testing whether people with dementia can be supported with stopping driving through the CarFreeMe program. In this study we will be delivering the CarFreeMe intervention to people living with dementia who are giving up driving or adjusting to driving cessation, and their family members, through a face-to-face trial in Queensland, and a telehealth trial throughout Australia.

We are seeking older adults who are living with dementia (aged 65+), and their carers/support persons (aged 18+), to participate in our driving cessation study. Interested people with dementia may be currently driving, or may have stopped driving in the past.

If you are interested in knowing more about the upcoming trials, or in knowing more about providing CarFreeMe to your clients, and have any questions about the study – please contact Dr Theresa Scott, at The University of Queensland, School of Psychology, or consult the website:
